

WEEK 12

Implement Python program - TCP/UDP program using Sockets

Q1) Develop a simple Python program of TCP, client that can connect to the server and client can send a "Hello, Server!" message to the server

```
1  import socket
2
3
4
5  # Create a client socket
6
7  clientSocket = socket.socket(socket.AF_INET, socket.SOCK_STREAM);
8
9
10
11 # Connect to the server
12
13 clientSocket.connect(("127.0.0.1",9090));
14
15
16
17 # Send data to server
18
19 data = "Hello Server!";
```

PROBLEMS OUTPUT DEBUG CONSOLE **TERMINAL** PORTS Python + - [] [X] ... ^ X

```
PS C:\Users\MANI\Desktop\week 12> & C:/Python312/python.exe "c:/Users/MANI/Desktop/week 12/Q1.py"

Accepted a connection request from 127.0.0.1:54916

Hello Server!
```

Q2) Develop a Python program that allows the TCP client to send a list of numbers to the server. The server should calculate and return the sum of the numbers to the client.

CLIENT SIDE

```

2  # Import socket module
3  import socket
4
5  # In this line we define our local host
6  # address with port number
7  SERVER = "127.0.0.1"
8  PORT = 8080
9  # Making a socket instance
10 client = socket.socket(socket.AF_INET,
11                        socket.SOCK_STREAM)
12 # connect to the server
13 client.connect((SERVER, PORT))
14 # Running a infinite loop
15 while True:
16     print("Example : 4 + 5")
17     # here we get the input from the user
18     inp = input("Enter the operation in \
19 the form oprend operator oprenad: ")
20     # If user wants to terminate
21     # the server connection he can type over
22     if inp == "Over":
23         break
24     # Here we send the user input
25     # to server socket by send Method
26     client.send(inp.encode())
27
28     # Here we received output from the server socket
29     answer = client.recv(1024)
30     print("Answer is "+answer.decode())
31     print("Type 'over' to terminate")
32
33 client.close()

```

SERVER SIDE

```

1  import socket
2
3  # Here we use localhost ip address
4  # and port number
5  LOCALHOST = "127.0.0.1"
6  PORT = 8080
7  # calling server socket method
8  server = socket.socket(socket.AF_INET,
9                        socket.SOCK_STREAM)
10 server.bind((LOCALHOST, PORT))
11 server.listen(1)
12 print("Server started")
13 print("Waiting for client request..")
14 # Here server socket is ready for
15 # get input from the user
16 clientConnection, clientAddress = server.accept()
17 print("Connected client :", clientAddress)
18 msg = ''
19 # Running infinite loop
20 while True:
21     data = clientConnection.recv(1024)
22     msg = data.decode()
23     if msg == "Over":
24         print("connection is Over")
25         break
26
27     print("Equation is received")
28     result = 0
29     operation_list = msg.split()
30     oprnd1 = operation_list[0]
31     operation = operation_list[1]
32     oprnd2 = operation_list[2]
33
34     # here we change str to int conversion
35     num1 = int(oprnd1)
36     num2 = int(oprnd2)
37     # Here we are perform basic arithmetic operation

```

```

$ python3 client.py
Example : 4 + 5
Enter the operation in the form oprend operator oprenad: 3 + 5
Answer is 8
Example : 4 + 5
Enter the operation in the form oprend operator oprenad:

```

```

$ python3 server.py
Server started
Waiting for client request..
Connected clinet : ('127.0.0.1', 60146)
Equation is recieved
Send the result to client

```

Q3) Create a Python UDP client that sends a "UDP Message" packet to a UDP server. Demonstrate the sending and receiving of the packet.

tut13.py - C:/Users/saura/Desktop/tut13.py (3.10.2)
